User Manual: Fixed Fields

Fixed Fields

Fixed Fields are special fields that come already created within the plugin such as the captcha spam blocker and email field. Fixed Fields do special things that you wouldn't be able to accomplish with normal fields; they cannot be deleted or created. For example, if you use the fixedEmail field, as opposed to creating your own email field. The users email will be checked to make sure it is valid, if it isn't a form error will be displayed. Below is a list of fixed fields and their descriptions.

- **fixedEmail:** When attached to a form and set to required, this field will validate a user's email addresses. If a user's email is not valid, an error will be shown.
- **captcha:** This field helps prevent spam by prompting users to copy numbers displayed on an image. If a user copies the numbers incorrectly, the form will show an error.
- **fixedWebsite:** When attached to a form and set to required, this field will validate a user's website. If a user's website is not valid, an error will be shown.
- **emailSubject:** This lets a user enter in an email subject that will carry over as the subject of the email sent to you on form completion
- **usaStates:** This field displays a dropdown of all the states in the US.
- **allCountries:** This field displays a dropdown of all the countries in the world.
- **resetButton:** Attaching this field adds a reset button right next to the submit button in your form.
- **ishuman:** This field helps prevent spam by prompting users to check a box to verify that they are human. If the box is left unchecked, an error will be displayed and the user will have to go back.
