User Manual: Email - Tag and Field Input

Nothing shows up in the email, even after adding a tag to the form! How can I include a new field's input in the email?

You need to add a new tag to the Mail fields. This tag should correspond to the tag in theForm you wish to include in the email. Thus, when you add a new form tag such as [text your-new-field], the corresponding email tag would be [your-new-field]. Only the second part of the tag ("your-new-field", in this case) is needed for the email.

A screenshot of an email form titled "Mail". The form has four input fields: "To:" with the value "takayukister@gmail.com", "From:" with the value "[your-name] <[your-email]>", "Subject:" with the value "[your-subject]", and "Message body:" with the value "[your-message]". The text "[your-name]", "<[your-email]>", "[your-subject]", and "[your-message]" are all underlined in red. A large red text overlay "Tags in Mail" is positioned over the "From:" field. Below the "Message body:" field, there is a separator line "--" and the text "This mail is creat".

A tag in the Mail field will be replaced with the user's input contained in a form field with the same name.
